Abstract 43

One or two sentences providing a **basic introduction** to the field, comprehensible to a

scientist in any discipline.

Two to three sentences of more detailed background, comprehensible to 46

scientists in related disciplines.

One sentence clearly stating the general problem being addressed by this

particular study. 49

48

55

56

One sentence summarizing the main result (with the words "here we show" or their 50

equivalent).

Two or three sentences explaining what the main result reveals in direct

comparison to what was thought to be the case previously, or how the main result adds

to previous knowledge.

One or two sentences to put the results into a more **general context**.

Two or three sentences to provide a **broader perspective**, readily comprehensible

to a scientist in any discipline.

Light Exposure Behavior Assessment (LEBA): Development of a novel instrument to capture light exposure-related behaviours

62 Introduction

- Light exposure is important
 - Light exposure Behavior is important
- Table: Overview Existing Related Scales: items in total / items on light exposure

 (behaviour)
- Existing Scales: Review them in text
- None of these do light exposure behavior.

Methods

Ethical approval

64

The cantonal ethics commission (Ethikkommission Nordwest- und Zentralschweiz, project ID Req-2021-00488) reviewed this project and issued an official clarification of responsibility (full document see Suppl. Fig X in appendix) stating: "The research project does not fall under the scope of the Human Research Act, because your project is using only anonymised data. An authorisation from the ethics committee is therefore not required and the EKNZ is not responsible for its review."

77 Data Availability

78 Survey characteristics

Data was collected in a quantitative cross-sectional approach via a fully anonymous online survey hosted on REDCap (Harris et al., 2019, 2009) by way of the University of

Basel sciCORE. Participants were recruited via the website of a Comic co-released with
the survey(Weinzaepflen & Spitschan, 2021), social media (i.e., LinkedIn, Twitter,
Facebook), mailing lists, word of mouth, the investigators' personal contacts, and
supported by distribution of the survey link via f.lux software (F.lux Software LLC, 2021).

Completing the online survey took approx. 15 to 20 minutes and was not 85 compensated. The first page of the survey comprised a participant information sheet, 86 where participants' informed consent to participate was obtained before any of the 87 questions were displayed. Underaged participants (<18 years) were urged to obtain 88 assent from their parents/legal guardians, before filling in the survey. Information on the 89 first page included the objectives of the study, inclusion criteria, estimated duration, the 90 use, storage and sharing of the data, compensation (none), and information about the 91 type of questions in the survey. Moreover, participants needed to confirm that they were 92 participating the survey for the first time. To ensure high data quality, five attention check items were included in the survey (e.g., "We want to make sure you are paying attention." What is 4+5?"). The data analysed in this study was collected between 17.05.2021 and 03.09.2021. Questions incorporating retrospective recall were all aligned to the period of "past four weeks," matching the presented LEBA instrument. 97

In addition to the LEBA questionnaire, which is subject of the current study, the following variables and items were assessed but not included in the analysis:

- Sleep disturbance and sleep-related impairment (adult and pediatric versions)
 (Bevans et al., 2019; Daniel J. Buysse et al., 2010; Forrest et al., 2018; Harb,
 Hidalgo, & Martau, 2015; L. Yu et al., 2011)
- Sleep duration, timing, and latency, chronotype, social jetlag, time in bed, work/sleep schedule and outdoor light exposure duration (version for adults and adolescents) (Roenneberg et al., 2003)
 - Sleep environment [Olivier et al. (2016)

100

101

102

103

104

105

106

- Meal timing & caffeine consumption [custom items]
- Light sensitivity (photophobia vs. photophilia) (Wu & Hallett, 2017)
- Self-reported pubertal stage (only if younger than 18 years old) (Petersen,
 Crockett, Richards, & Boxer, 1988)

Furthermore, the following 1-item demographic variables were assessed:

- 112 Age
- 113 Sex

117

118

- Gender identity
- Occupational Status
- COVID-19 related Occupational setting during the past four weeks
 - Time zone & country of residence
 - English as native language

119 Participants

Table 1 summarizes the survey participants' demographic characteristics. Only 120 participants completing the full LEBA questionnaire were included, thus there are no 121 missing values in the item analyses. XX participants were excluded from analysis due to 122 not passing at least one of the "attention check" items. For exploring initial factor 123 structure (EFA), a sample of 250-300 is recommended (Comrey & Lee, 1992; Schönbrodt & Perugini, 2013). For estimating the sample size for the confirmatory factor 125 analysis (CFA) we followed the N:q rule (Bentler & Chou, 1987; Jackson, 2003; Kline, 2015; Worthington & Whittaker, 2006), where ten participants per parameter is required to earn trustworthiness of the result. Our sample size exceeds these requirements: Anonymous responses from a total of n = 690 participants were included in the analysis 129 of the current study, split into samples for exploratory (EFA: n = 428) and confirmatory 130 factor analysis (CFA: n = 262). The EFA sample included participants filling out the 131

questionnaire from 17.05.2021 to XX.XXXXXX, whereas participants who filled out the questionnaire from YY.YY.YYYY to 03.09.2021 were included in the CFA analysis.

Participants indicated filling out the online survey from a diverse range of geographic locations. The four most common geographic locations included:

| | х |
|---|----|
| United States - America/New_York (UTC -04:00) | 63 |
| United Kingdom - Europe/London (UTC) | 57 |
| Germany - Europe/Berlin (UTC +01:00) | 53 |
| India - Asia/Kolkata (UTC +05:30) | 38 |

136

137

For a full list of geographic locations, see Suppl. Table X in the appendix.

Age among all participants ranged from 11 years to 84 years [EFA: min = 11, max = 138 84; CFA: min = 12, max = 74], with an overall mean of ~ 33 years of age [Overall: M =139 32.95, SD = 14.57; EFA: M = 32.99, SD = 15.11; CFA: M = 32.89, SD = 13.66]. In total 140 325 (47%) of the participants indicated female sex [EFA: 189 (44%); CFA: 136 (52%)], 141 351 (51%) indicated male [EFA: 230 (54%); CFA: 121 (46%)] and 14 (2.0%) indicated 142 other sex [EFA: 9 (2.1%), CFA: 5 (1.9%)]. Overall, 49 (7.2%) [EFA: 33 (7.8%); CFA: 16 143 (6.2%)] participants indicated a gender-variant identity. In a "Yes/No" question regarding 144 native language, 320 (46%) of respondents [EFA: 191 (45%); CFA: 129 (49%)] indicated 145 to be native English speakers. For their "Occupational Status," more than half of the 146 overall sample reported that they currently work [Overall: 396 (57%); EFA: 235 (55%); CFA: 161 (61%)], whereas 174 (25%) [EFA: 122 (29%); CFA: 52 (20%)] reported that 148 they go to school and 120 (17%) [EFA: 71 (17%); CFA: 49 (19%)] responded that they do "Neither." With respect to the COVID-19 pandemic we asked participants to indicate their occupational setting during the last four weeks: In the overall sample 303 (44%) [EFA: 151 194 (45%); CFA: 109 (42%)] of the participants indicated that they were in a home office/ 152 home schooling setting., while 109 (16%) overall [EFA: 68 (16%); CFA: 41 (16%)] 153 reported face-to-face work/schooling. Lastly, 147 (21%) overall [EFA: 94 (22%); CFA: 53 154

(20%)] reported a combination of home- and face-to-face work/schooling, whereas 131 155 (19%) overall [EFA: 72 (17%); CFA: 59 (23%)] filled in the "Neither (no work or school, or 156 indication)" response option. We tested all demographic variables in Table 1 for 157 significant group differences between the EFA and CFA sample, applying Wilcoxon rank 158 sum test for the continuous variable "Age" and Pearson's Chi-squared test for all other 159 categorical variables via the gtsummary R package's "add_p" function (Sjoberg et al., 160 2021a). The p-values were corrected for multiple testing applying false discovery rate 161 (FDR) via the "add_q" function of the same package. After p-value (FDR) correction for 162 multiple testing, none of the demographic variables were significantly different between 163 the EFA sample and the CFA sample (all g-values $q \ge 0.2$, indicating equivalence).

 - **Data Collection.** Timeline of data collection, mode of data collection.

Analytic Strategies

We used R (version 4.1.0), including several R packages, for our analyses. Initially, 178 our tool have six poin Likert type response scale(0:Does not apply/I don't know; 1:Never, 179 2:Rarely; 3:Sometimes; 4:Often; 5: Alsways). As our purpose was to capture light 180 exposure related behavior, "Does not apply/I don't know" and "Never" were providing 181 similar information. As such we decided to collapse "Does not apply/I don't know" and 182 "Never" options into one making it a 5 point Likert type response scale. Necessary 183 assumptions of EFA, including sample adequacy, normality assumptions, quality of 184 correlation matrix, were assessed. Our data violated both the univariate and multivariate 185 normality assumptions. Due to these violations and the ordinal nature of our response 186 data, we used a polychoric correlation matrix (C. Desjardins & Bulut, 2018) for the EFA. 187 We employed principal axis (PA) as a factor extraction method with varimax rotation. PA 188 is robust to the normality assumption violations (Watkins, 2020). The obtained latent 189 structure was confirmed by another factor extraction method: the minimum residuals 190 extraction method as well. We used a combination factor identification method including 191 scree plot(Cattell, 1966), Horn's parallel analysis (Horn, 1965), minimum average 192 partials method(Velicer, 1976), and hull method (Lorenzo-Seva, Timmerman, & Kiers, 193 2011) to identify factor numbers. Additionally, to determine the simple structure, we followed the following guidelines recommended by psychometricians (i) no factors with 195 fewer than three items (ii) no factors with a factor loading <0.3 (iii) no items with 196 cross-loading greater than .3 across factors (Bandalos & Finney, 2018) We also 197 conducted psychometric analysis on non-merged response options data (supplementary 198 analysis) and rejected the latent structure obtained as the factors were less interpretable. 199

200 Results

Exploratory Factor Analysis

Sampling adequacy was checked using Kaiser-Meyer-Olkin (KMO) measures of 202 sampling adequacy(Kaiser, 1974). The overall KMO vale for 48 items was 0.63 which 203 was above the cutoff value (.50) indicating a mediocre sample (Hutcheson, 1999). 204 Table3 summarizes the univariate descriptive statistics for the 48 items. some of the 205 items were skewed with high Kurtosis values. Our data violated both univariate normality 206 (Shapiro-Wilk statistics; (Shapiro & Wilk, 1965)) and multivariate normality assumptions 207 (Marida's test;(Mardia, 1970)). Multivariate skew was = 583.80 (p <0.001) and 208 multivariate kurtosis was = 2,749.15 (p < 0.001). Due to these violations and ordinal 209 nature of the response data polychoric correlations over Pearson's correlations was 210 chosen (C. Desjardins & Bulut, 2018). Bartlett's test of sphericity (Bartlett, 1954), χ^2 211 (1128) = 5042.86, p < .001] indicated the correlations between items are adequate for 212 the EFA. However only 4.96% of the inter-item correlation coefficients were greater than .30. The inter item correlation ranged between .44 to .91. And the corrected item-total correlations ranged between .10 to .44.

216

217

218

219

221

201

Scree plot (Figure 3) suggested a six-factor solution. Horn's parallel analysis (Horn, 1965) with 500 iterations also indicated a six-factor solution. However, the minimum average partial (MAP) method (Velicer, 1976) and Hull method (Lorenzo-Seva et al., 2011) suggested a five-factor solution. As a result, we tested both five-factor and six-factor solutions.

With initial 48 items we conducted three rounds of EFA gradually discarded problematic items. (cross-loading items and poor factor loading (<.30) items). Finally, a five-factor EFA solution with 25 items was accepted with low RMSR = 0.08 (Brown,

2015), all factor-loading higher than .30 and no cross-loading greater than .30. We confirmed this five-factor latent structure using varimax rotation with a minimum residual 226 extraction method (Table??). Table4 displays the factor-loading (structural coefficients) 227 and communality of the items. The absolute value of the factor-loading ranged from -.49 228 to .99 indicating strong coefficients. The commonalities ranged between .11 to .99. 229 However, the histogram of the absolute values of non-redundant residual-correlations 230 Fig5 showed 26% correlations greater than the absolute value of .05, indicating a 231 possible under-factoring. (C. D. Desjardins, 2018). Subsequently, we fitted a six-factor 232 solution. However, a factor emerged with only one salient variable loading in the 233 six-factor solution, thus disqualifying the six-factor solution (Table??).

In the five-factor solution, the first factor contained three items and explained 235 10.25% of the total variance with a satisfactory internal reliability coefficient (α = .86). All 236 the items in this factor stemmed from the individual's preference to use blue light filters in 237 different light environments. The second factor contained six items and explained 9.93% 238 of the total variance with a satisfactory internal reliability coefficient (α = .71). Items 239 under this factor commonly investigate an individual's hours spent outdoor. The third 240 factor contained five items and explained 8.83% of the total variance. Items under this 241 factor dealt with the specific behaviors pertaining to sleep. The internal consistency 242 reliability coefficient was, α = .68. The fourth factor contained five items and explained 243 8.44% of the total variance with an internal consistency coefficient, α = .62. These five items stemmed from the behavior related to an individual's cellphone usage during the 245 sleep-wakeup time. Lastly, the fifth factor contained six items and explained 6.14% of the total variance. This factor tried to measure an individual's behavior lead by the awareness of light's influence on health. However, this factor showed unsatisfactory internal consistency reliability (α = .53). It is essential to attain a balance between psychometric properties and interpretability of the common themes when exploring the 250 latent structure. As all of the emerged factors are highly interpretable and relevant 251

towards our aim to capture light exposure related behavior, regardless of the apparent low reliability of the two factors, we retain the five-factor solution with 23 items for our confirmatory factor analysis (CFA). Two items showed negative factor-loading (items 44 and 21). Upon inspection, it was understood that these items are negatively correlated to the common theme, and thus in the CFA analysis, we reversed the response code for these two items.

Confirmatory Factor Analysis

We conducted a categorical confirmatory factor analysis with robust weighted least 259 square (WLSMV) estimator as our response data was in ordinary nature(C. Desjardins & 260 Bulut, 2018). Several indices are suggested to measure model fit. These indices can be 261 categorized as absolute, comparative and parsimony fit indices (Brown, 2015). Absolute 262 fit assess the model fit at an absolute level using indices including chi-square test 263 statistics and the standardized root mean square (SRMR) parsimony fit indices including 264 the root mean square error of approximation (RMSEA) considers the number of free 265 parameters in the model to assess the parsimony of the model. Comparative fit indices 266 evaluate the fit of the specified model solution in relation to a more restricted baseline 267 model restricting all covariances among the idicators as zero. Comparative fit index (CFI) 268 and the Tucker Lewis index (TLI) are such two comparative fit indices. Commonly used 269 Model fit quidelines (Hu & Bentle, 1999; Schumacker & Lomax, 2004) includes (i) 270 Reporting of chi-square test statistics (A non-significant test statistics is required to 271 reflect model fit) (i) CFI and TLI (CFI/TLI close to .95 or above/ranging between 90-95 and above) (ii) RMSEA (close to .06 or below), (iii) SRMR (close to .08 or below) to estimate the model fit. Table 5 summarizes the fit indices of our fitted model. Our fitted model failed to attain an absolute fit estimated by the chi-square test. However, the chi-square test is sensitive to sample size and not recommended to be used as the sole 276 index of absolute model fit (Brown, 2015). Another absolute fit index we obtained in our

analysis was SRMR which does not work well with categorical data (C.-Y. Yu, 2002).

Subsequently, we judged the model fit based on the comparative fit indices: CFI, TLI and parsimony fit index-RMSEA. Our fitted model attained acceptable fit (CFI =.94; TLI = .93); RMSEA = .06,

$$.05 - .07, 90$$

) with two imposed equity constrain on item pairs 32-33 and 19-17. However SRMR value was higher than the guideline (SRMR = .12). Further by allowing one pair of items (30-41) to covary their error variance and discarding two item (item 37 & 26) for very low r-square value, our model attained best fit (CFI = .97; TLI = .96); RMSEA = .05

$$.04 - .06, 90$$

) and SRMR value (SRMR = .09) was also close to the suggestions of Hu and Bentle (1999). Since reliability coefficient Cronbach's alpha tends to mis-measure reliability for multidimensional construct (Sijtsma, 2009) we report Mcdonald's omega(total) as the internal consistency reliability coefficient. Mcdonald's omega(total) is reported to be a satisfactory lower bound reliability coefficient that works for both unidimensional and multidimensional construct (Zinbarg, Revelle, Yovel, & Li, 2005). Mcdonald's omega(total) for the five factors were .90, .80, .61, .72, .45 respectively. Mcdonald's omega(total) coefficient for the total scale was .73.

Analysing the quality of items by Item Information Theory

We sought the IRT to gether information regarding the item quality. IRT complements the conventional classical test theory-based analysis by gathering information on item discrimination and item difficulty(Baker, 2017). Here, an item's quality is judged based on item information in relation to participants' latent trait level (θ). We gathered evidence on item quality by fitting each factor of LEBA with the graded response model (7 to the combined EFA sample and CFA sample (n =690). Item

discrimination indicates the pattern of variation in the categorical responses with the changes in latent trait, and item information curve (IIC) indicates the amount of information an item carries along the latent trait continuum. Here, we reported the item discrimination parameter and only discarded the items with relatively flat item information curve (information <.2) to develop the short form of LEBA. Baker (2017) categorized the item discrimination in as none = 0; very low =0.01 to 0.34; low = 0.35 to 0.64; moderate = 0.65 to 1.34; high = 1.35 to 1.69; very high >1.70. Item discrimination parameters of our scale fell in very high (10 items), high (4 items), moderate (4 items), low (5 items) indicating a good range of discrimination along the latent trait. Examination of the item information curve indicated 6 items (1, 25, 9, 38, 30, & 41) had relatively flat information curves thus discarded. We also gathered evidence of item fit and person fit to our fitted model.

Test information curve (TIC) indicate the amount of information an the full-scale carry along the latent trait continuum. As we treated each factor of LEBA as an unidmensional construct we obtain 5 TICs. These information curves indicated except blue filter factor, the other factor's TICs are roughly centered on the center of the trait continuum ((θ)). Also the amount of information changed rather steadily with the change of (θ). Thus we conferred the LEBA scale (except blue filter) estimated the light exposure related behavior with precision near the center of trait continuum (Baker, 2017) which is sufficient to discriminate between latent trait measured by the each factor. The blue filter factor had a peak to the right side of the center of latent trait indicating its ability to providing information only for people who already have some preference towards using blue-filters.

Our result also indicated all the items fitted well to the respective models as assessed by assessed by RMSEA value obtained from Signed-X2 index implementation. All of the items had RMSEA value <.06 indicating adequate fit. Person fit indicates the validity and meaningfulness of the fitted model at the participants latent trait level (C.

Desjardins & Bulut, 2018). We estimated the person fit statistics using standardized fit index Zh statistics (Drasgow, Levine, & Williams, 1985). Zh < -2 should be considered as a misfit. Fig indicates that Zh is larger than -2 for most participants, suggesting a good fit of the selected IRT models.

The overall we can concluded that IRT analysis indicated LEBA is a psychometrically sound measure. Item fit indexes and person fit index for all five fitted model were acceptable. Items had diverse slope parameters indicating a good range of discrimination- the ability to differentiate respondents with different levels of the light exposure related behavior. All-in-all we can recommend the LEBA to be used to capture light exposure related behavior.

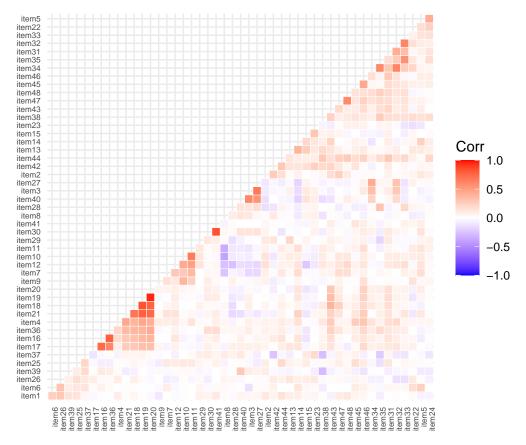

Figure B1. Correlation plot of the items

Horn's parallel analysis with 500 iterations indicated a five-factor solution. However, Scree plot and the MAP method suggested 6-factor solution. five-factor solution. As a result, we tested both five-factor and six-factor solutions.

Five Factor Solution[Unmerged Responses] (24 Items)

F1

629

630

631

I use light therapy applying a blue light box.

I use light therapy applying a light visor.

I use light therapy applying a white light box.

I use light therapy applying another form of light device.

Five Factor Solution[Unmerged Responses] (24 Items)

I use an alarm with a dawn simulation light.

F2

I spend more than 3 hours per day (in total) outside.

I spend between 1 and 3 hours per day (in total) outside.

I spend as much time outside as possible.

I spend 30 minutes or less per day (in total) outside.

I go for a walk or exercise outside within 2 hours after waking up.

I spend between 30 minutes and 1 hour per day (in total) outside.

F3

I look at my mobile phone screen immediately after waking up.

I use my mobile phone within 1 hour before attempting to fall asleep.

I check my phone when I wake up at night.

F4

I use a blue-filter app on my computer screen within 1 hour before attempting to fall asleep.

I seek out knowledge on how to improve my light exposure.

I dim my computer screen within 1 hour before attempting to fall asleep.

I discuss the effects of light on my body with other people.

I modify my light environment to match my current needs.

I dim my room light within 1 hour before attempting to fall asleep.

I use as little light as possible when I get up during the night.

F5

I wear blue-filtering, orange-tinted, and/or red-tinted glasses indoors during the day.

I wear blue-filtering, orange-tinted, and/or red-tinted glasses outdoors during the day.

Five Factor Solution[Unmerged Responses] (24 Items)

I wear blue-filtering, orange-tinted, and/or red-tinted glasses within 1 hour before attempting to fall asleep.

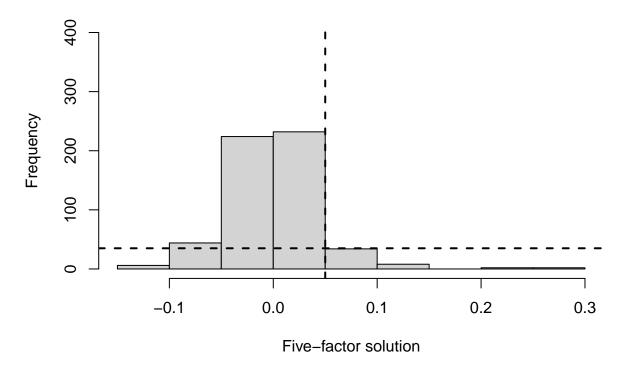

Figure B3. Histogram of residulas: five-factor solution

Appendix C

Disclaimer: This is a non-public version of LEBA (dated November 12, 2021) and still a work in progress. Please do not distribute!

LEBA captures light exposure-related behaviours on a 5 point Likert type scale
ranging from 1 to 5 (Never/Does not apply/I don't know = 1; Rarely = 2; Sometimes = 3;
Often = 4; Always = 5). The score of each factor is calculated by the summation of
scores of items belonging to the corresponding factor. The following instruction is given
before displaying the items: "Please indicate how often you performed the following
behaviours in the past 4 weeks."

Appendix D

LEBA Long Form (23 Items)

| | Items | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|---|--------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 1 | I wear blue-filtering, | | | | | |
| | orange-tinted, and/or | | | | | |
| | red-tinted glasses indoors | | | | | |
| | during the day. | | | | | |
| 2 | I wear blue-filtering, | | | | | |
| | orange-tinted, and/or | | | | | |
| | red-tinted glasses outdoors | | | | | |
| | during the day. | | | | | |
| 3 | I wear blue-filtering, | | | | | |
| | orange-tinted, and/or | | | | | |
| | red-tinted glasses within 1 | | | | | |
| | hour before attempting to fall | | | | | |
| | asleep. | | | | | |
| 4 | I spend 30 minutes or less | | | | | |
| | per day (in total) outside. | | | | | |

| | Items | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|----|-------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 5 | I spend between 1 and 3 | | | | | |
| | hours per day (in total) | | | | | |
| | outside. | | | | | |
| 6 | I spend between 30 minutes | | | | | |
| | and 1 hour per day (in total) | | | | | |
| | outside. | | | | | |
| 7 | I spend more than 3 hours | | | | | |
| | per day (in total) outside. | | | | | |
| 8 | I spend as much time outside | | | | | |
| | as possible. | | | | | |
| 9 | I go for a walk or exercise | | | | | |
| | outside within 2 hours after | | | | | |
| | waking up. | | | | | |
| 10 | I use my mobile phone within | | | | | |
| | 1 hour before attempting to | | | | | |
| | fall asleep. | | | | | |

| | Items | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|----|--------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 11 | I look at my mobile phone | | | | | |
| | screen immediately after | | | | | |
| | waking up. | | | | | |
| 12 | I check my phone when I | | | | | |
| | wake up at night. | | | | | |
| 13 | I look at my smartwatch | | | | | |
| | within 1 hour before | | | | | |
| | attempting to fall asleep. | | | | | |
| 14 | I look at my smartwatch | | | | | |
| | when I wake up at night. | | | | | |
| 15 | I dim my mobile phone | | | | | |
| | screen within 1 hour before | | | | | |
| | attempting to fall asleep. | | | | | |
| 16 | I use a blue-filter app on my | | | | | |
| | computer screen within 1 | | | | | |
| | hour before attempting to fall | | | | | |
| | asleep. | | | | | |

| | Items | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|----|-----------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 17 | I use as little light as possible | | | | | |
| | when I get up during the | | | | | |
| | night. | | | | | |
| 18 | I dim my computer screen | | | | | |
| | within 1 hour before | | | | | |
| | attempting to fall asleep. | | | | | |
| 19 | I use tunable lights to create | | | | | |
| | a healthy light environment. | | | | | |
| 20 | I use LEDs to create a | | | | | |
| | healthy light environment. | | | | | |
| 21 | I use a desk lamp when I do | | | | | |
| | focused work. | | | | | |
| 22 | I use an alarm with a dawn | | | | | |
| | simulation light. | | | | | |
| 23 | I turn on the lights | | | | | |
| | immediately after waking up. | | | | | |

40 Latent Structure, Reliability and Structural Validity

The long form of LEBA consists 23 items with five factors.

| | | Reliability Coefficients: | Reliability Coefficients: |
|------------------------------------|----------------|---------------------------|---------------------------|
| Factor names | Items | McDonald's Omega | Cronbach's alpha |
| F1: Wearing blue light filters | 1-3 | .93 | .90 |
| F2: Spending time outdoors | 4-9 (Item 4 is | .80 | .78 |
| | reversed) | | |
| F3: Using phone and smartwatch | 10-14 | .61 | .62 |
| in bed | | | |
| F4: Using light before bedtime | 15-18 | .72 | .62 |
| F5: Using light in the morning and | 19-23 | .45 | .41 |
| during daytime | | | |
| | | .73(Total scale) | |

LEBA -long form showed satisfactory structural validity (CFI =.97; TLI = .96; RMSEA = .05[.04-.06, 90% CI]; SRMR = .09).

LEBA Short Form (17 Items)

| | Short Form (17 Items) | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|----|--------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 01 | I wear blue-filtering, | | | | | |
| | orange-tinted, and/or | | | | | |
| | red-tinted glasses indoors | | | | | |
| | during the day. | | | | | |
| 02 | I wear blue-filtering, | | | | | |
| | orange-tinted, and/or | | | | | |
| | red-tinted glasses outdoors | | | | | |
| | during the day. | | | | | |
| 03 | I wear blue-filtering, | | | | | |
| | orange-tinted, and/or | | | | | |
| | red-tinted glasses within 1 | | | | | |
| | hour before attempting to fall | | | | | |
| | asleep. | | | | | |
| 04 | I spend 30 minutes or less | | | | | |
| | per day (in total) outside. | | | | | |

| | Short Form (17 Items) | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|---|------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 5 | I spend between 1 and 3 | | | | | |
| | hours per day (in total) | | | | | |
| | outside. | | | | | |
| 6 | I spend more than 3 hours | | | | | |
| | per day (in total) outside. | | | | | |
| 7 | I spend as much time outside | | | | | |
| | as possible. | | | | | |
| 8 | I go for a walk or exercise | | | | | |
| | outside within 2 hours after | | | | | |
| | waking up. | | | | | |
| 9 | I use my mobile phone within | | | | | |
| | 1 hour before attempting to | | | | | |
| | fall asleep. | | | | | |
| 0 | I look at my mobile phone | | | | | |
| | screen immediately after | | | | | |
| | waking up. | | | | | |
| 1 | I check my phone when I | | | | | |
| | wake up at night. | | | | | |

| | Short Form (17 Items) | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|----|--------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 12 | I dim my mobile phone | | | | | |
| | screen within 1 hour before | | | | | |
| | attempting to fall asleep. | | | | | |
| 13 | I use a blue-filter app on my | | | | | |
| | computer screen within 1 | | | | | |
| | hour before attempting to fall | | | | | |
| | asleep. | | | | | |
| 14 | I dim my computer screen | | | | | |
| | within 1 hour before | | | | | |
| | attempting to fall asleep. | | | | | |
| 15 | I use tunable lights to create | | | | | |
| | a healthy light environment. | | | | | |
| 16 | I use LEDs to create a | | | | | |
| | healthy light environment. | | | | | |
| 17 | I use an alarm with a dawn | | | | | |
| | simulation light. | | | | | |

645 Latent Structure, Reliability and Structural Validity

The short form of LEBA consists 23 items with five factors.

| Factor names | Items | | |
|---|--------------------------|--|--|
| F1: Wearing blue light filters | 1-3 | | |
| F2: Spending time outdoors | 4-8 (Item 4 is reversed) | | |
| F3: Using phone and smart-watch in bed | 9-11 | | |
| F4: Using light before bedtime | 12-14 | | |
| F5: Using light in the morning and during daytime | 15-17 | | |
