Abstract 43

One or two sentences providing a **basic introduction** to the field, comprehensible to a

scientist in any discipline.

Two to three sentences of more detailed background, comprehensible to 46

scientists in related disciplines.

One sentence clearly stating the general problem being addressed by this

particular study. 49

One sentence summarizing the main result (with the words "here we show" or their 50

equivalent).

48

55

56

Two or three sentences explaining what the **main result** reveals in direct

comparison to what was thought to be the case previously, or how the main result adds

to previous knowledge.

One or two sentences to put the results into a more general context.

Two or three sentences to provide a **broader perspective**, readily comprehensible

to a scientist in any discipline.

Light Exposure Behavior Assessment (LEBA): Development of a novel instrument to capture light exposure-related behaviours

62 Introduction

- Light exposure is important
 - Light exposure Behavior is important
- Table: Overview Existing Related Scales: items in total / items on light exposure (behaviour)
- Existing Scales: Review them in text
- None of these do light exposure behavior.

69 Methods

Ethical approval

64

The cantonal ethics commission (Ethikkommission Nordwest- und Zentralschweiz, project ID Req-2021-00488) reviewed this project and issued an official clarification of responsibility (full document see Suppl. Fig X in appendix) stating: "The research project does not fall under the scope of the Human Research Act, because your project is using only anonymised data. An authorisation from the ethics committee is therefore not required and the EKNZ is not responsible for its review."

77 Data Availability

78 Survey characteristics

Data was collected in a quantitative cross-sectional approach via a fully anonymous online survey hosted on REDCap (Harris et al., 2019, 2009) by way of the University of

Basel sciCORE. Participants were recruited via the website of a Comic co-released with the survey(Weinzaepflen & Spitschan, 2021), social media (i.e., LinkedIn, Twitter, 82 Facebook), mailing lists, word of mouth, the investigators' personal contacts, and 83 supported by distribution of the survey link via f.lux software (F.lux Software LLC, 2021). 84

Completing the online survey took approx. 15 to 20 minutes and was not 85 compensated. The first page of the survey comprised a participant information sheet, 86 where participants' informed consent to participate was obtained before any of the 87 questions were displayed. Underaged participants (<18 years) were urged to obtain 88 assent from their parents/legal guardians, before filling in the survey. Information on the first page included the objectives of the study, inclusion criteria, estimated duration, the use, storage and sharing of the data, compensation (none), and information about the 91 type of questions in the survey. Moreover, participants needed to confirm that they were 92 participating the survey for the first time. To ensure high data quality, five attention check items were included in the survey (e.g., "We want to make sure you are paying attention. What is 4+5?"). The data analysed in this study was collected between 17.05.2021 and 03.09.2021. Questions incorporating retrospective recall were all aligned to the period of 'past four weeks," matching the presented LEBA instrument.

In addition to the LEBA questionnaire, which is subject of the current study, the 98 following variables and items were assessed but not included in the analysis:

- Sleep disturbance and sleep-related impairment (adult and pediatric versions) (Bevans et al., 2019; Daniel J. Buysse et al., 2010; Forrest et al., 2018; Harb, Hidalgo, & Martau, 2015; L. Yu et al., 2011)
- Sleep duration, timing, and latency, chronotype, social jetlag, time in bed, 103 work/sleep schedule and outdoor light exposure duration (version for adults and adolescents) (Roenneberg, Wirz-Justice, & Merrow, 2003) 105
 - Sleep environment (Olivier et al., 2016)

100

101

102

104

106

- Meal timing & caffeine consumption [custom items]
- Light sensitivity (photophobia vs. photophilia) (Wu & Hallett, 2017)
- Self-reported pubertal stage (only if younger than 18 years old) (Petersen,
 Crockett, Richards, & Boxer, 1988)

Furthermore, the following 1-item demographic variables were assessed:

112 • Age

107

- 113 Sex
- Gender identity
- Occupational Status
- COVID-19 related Occupational setting during the past four weeks
- Time zone & country of residence
 - English as native language

119 Participants

118

Table 1 summarizes the survey participants' demographic characteristics. Only 120 participants completing the full LEBA questionnaire were included, thus there are no 121 missing values in the item analyses. XX participants were excluded from analysis due to 122 not passing at least one of the "attention check" items. For exploring initial factor 123 structure (EFA), a sample of 250-300 is recommended (Comrey & Lee, 1992; Schönbrodt & Perugini, 2013). For estimating the sample size for the confirmatory factor 125 analysis (CFA) we followed the N:q rule (Bentler & Chou, 1987; Jackson, 2003; Kline, 2015; Worthington & Whittaker, 2006), where ten participants per parameter is required to earn trustworthiness of the result. Our sample size exceeds these requirements: Anonymous responses from a total of n = 690 participants were included in the analysis 129 of the current study, split into samples for exploratory (EFA: n = 428) and confirmatory 130 factor analysis (CFA: n = 262). The EFA sample included participants filling out the 131

questionnaire from 17.05.2021 to XX.XX.XXXX, whereas participants who filled out the questionnaire from YY.YY.YYYY to 03.09.2021 were included in the CFA analysis.

Participants indicated filling out the online survey from a diverse range of geographic

• United States - America/New York (UTC -04:00): 63 (9.1%)

locations. The ten most common geographic locations included:

- United Kingdom Europe/London (UTC): 57 (8.3%)
- Germany Europe/Berlin (UTC +01:00): 53 (7.7%)
- India Asia/Kolkata (UTC +05:30): 38 (5.5%)

135

- United States America/Los Angeles (UTC -07:00): 37 (5.4%)
- United States America/Chicago (UTC -05:00): 30 (4.3%)
- France Europe/Paris (UTC +01:00): 22 (3.2%)
- Switzerland Europe/Zurich (UTC +01:00): 21 (3.0%)
- Brazil America/Sao Paulo (UTC -03:00): 19 (2.8%)
- Netherlands Europe/Amsterdam (UTC +01:00): 19 (2.8%)

For a full list of geographic locations, see Suppl. Table X in the appendix.

Age among all participants ranged from 11 years to 84 years [EFA: min = 11, max = 147 84; CFA: min = 12, max = 74], with an overall mean of ~ 33 years of age [Overall: M = 12] 148 32.95, SD = 14.57; EFA: M = 32.99, SD = 15.11; CFA: M = 32.89, SD = 13.66]. In total 149 325 (47%) of the participants indicated female sex [EFA: 189 (44%); CFA: 136 (52%)], 150 351 (51%) indicated male [EFA: 230 (54%); CFA: 121 (46%)] and 14 (2.0%) indicated 151 other sex [EFA: 9 (2.1%), CFA: 5 (1.9%)]. Overall, 49 (7.2%) [EFA: 33 (7.8%); CFA: 16 (6.2%)] participants indicated a gender-variant identity. In a "Yes/No" question regarding native language, 320 (46%) of respondents [EFA: 191 (45%); CFA: 129 (49%)] indicated 154 to be native English speakers. For their "Occupational Status," more than half of the 155 overall sample reported that they currently work [Overall: 396 (57%); EFA: 235 (55%); 156 CFA: 161 (61%)], whereas 174 (25%) [EFA: 122 (29%); CFA: 52 (20%)] reported that 157

they go to school and 120 (17%) [EFA: 71 (17%); CFA: 49 (19%)] responded that they do "Neither." With respect to the COVID-19 pandemic we asked participants to indicate their 159 occupational setting during the last four weeks: In the overall sample 303 (44%) [EFA: 160 194 (45%); CFA: 109 (42%)] of the participants indicated that they were in a home office/ 161 home schooling setting, while 109 (16%) overall [EFA: 68 (16%); CFA: 41 (16%)] 162 reported face-to-face work/schooling. Lastly, 147 (21%) overall [EFA: 94 (22%); CFA: 53 163 (20%)] reported a combination of home- and face-to-face work/schooling, whereas 131 164 (19%) overall [EFA: 72 (17%); CFA: 59 (23%)] filled in the "Neither (no work or school, or 165 on vacation)" response option. We tested all demographic variables in Table 1 for 166 significant group differences between the EFA and CFA sample, applying Wilcoxon rank 167 sum test for the continuous variable "Age" and Pearson's χ^2 test for all other categorical variables via the gtsummary R package's "add p" function (Sjoberg et al., 2021a). The p-values were corrected for multiple testing applying false discovery rate (FDR) via the 170 "add q" function of the same package. After p-value (FDR) correction for multiple testing, none of the demographic variables were significantly different between the EFA sample 172 and the CFA sample (all q-values $q \ge 0.2$, indicating equivalence). 173

74 Item Generation

178 Analytic Strategies

For our analysis we used R (version 4.1.0), with several R packages. Initially, our tool had six point Likert type response format (0:Does not apply/I don't know; 1:Never, 2:Rarely; 3:Sometimes; 4:Often; 5:Always). Our purpose was to capture light exposure

related behavior and these two response options: "Does not apply/I don't know" and 182 "Never" were providing similar information. As such we decided to collapse them into 183 one making it a 5 point Likert type response format. Necessary assumptions of EFA, 184 including sample adequacy, normality assumptions, quality of correlation matrix, were 185 assessed. Our data violated both the univariate and multivariate normality assumptions. 186 Due to these violations and the ordinal nature of our response data, we used polychoric 187 correlation matrix (Designations & Bulut, 2018) for the EFA. We employed principal axis 188 (PA) as factor extraction method with varimax rotation. PA is robust to the normality 189 assumption violations (Watkins, 2020). The obtained latent structure was confirmed by 190 another factor extraction method: "the minimum residuals extraction" as well. We used a 191 combination of factor identification method including scree plot (Cattell, 1966), Horn's 192 parallel analysis (Horn, 1965), minimum average partials method (Velicer, 1976), and 193 hull method (Lorenzo-Seva, Timmerman, & Kiers, 2011) to identify factor numbers. 194 Additionally, to determine the simple structure, we followed the following guidelines 195 recommended by psychometricians (i) no factors with fewer than three items (ii) no 196 factors with a factor loading <0.3 (iii) no items with cross-loading greater than .3 across 197 factors (Bandalos & Finney, 2018). We confirmed the latent structure obtained in the 198 EFA by conducting a "Confirmatory Factor Analysis" (CFA) using "robust weighted least 199 square estimator" (WLSMV). We estiablished the measurement invariance of our tool 200 across native and non-native English speakers using structural equation model 201 framework. To assess the possible semantic overlap of our tool with the existing tools, 202 we sought to "Semantic Scale Network" (Rosenbusch, Wanders, & Pit, 2020). Lastly, we 203 sought "Item Response Theory" (IRT) based analysis on developing a short form of 204 LEBA. We also conducted psychometric analysis on non-merged response options data 205 (Supp. Table B2) and rejected the latent structure obtained as the factors were less 206 interpretable. 207

208 Results

209 Item Analysis

Table 3 summarizes the univariate descriptive statistics for the 48 items. Some of the items were skewed with high Kurtosis values. Our data violated both univariate normality (Shapiro-Wilk statistics; (Shapiro & Wilk, 1965)) and multivariate normality assumptions [Marida's test;(Mardia, 1970)]. Multivariate skew was = 583.80 (p <0.001) and multivariate kurtosis was = 2,749.15 (p <0.001). Due to these violations and ordinal nature of the response data polychoric correlations over Pearson's correlations was chosen (Desjardins & Bulut, 2018). The corrected item-total correlation ranges between .03 -.48. However, no item was discarded based on descriptive statistics or item analysis.

Exploratory Factor Analysis

Sampling adequacy was checked using Kaiser-Meyer-Olkin (KMO) measures of sampling adequacy (Kaiser, 1974) . The overall KMO vale for 48 items was 0.63 which was above the cutoff value (.50) indicating a mediocre sample (Hutcheson, 1999). Bartlett's test of sphericity (Bartlett, 1954), χ^2 (1128) = 5042.86, p < .001 indicated the correlations between items are adequate for the EFA. However only 4.96% of the inter-item correlation coefficients were greater than .30. The inter item correlation ranged between .44 to .91.

Scree plot (Figure 3) suggested a six-factor solution. Horn's parallel analysis (Horn, 1965) with 500 iterations also indicated a six-factor solution. However, the minimum average partial (MAP) method (Velicer, 1976) and Hull method (Lorenzo-Seva et al., 2011) suggested a five-factor solution. As a result, we tested both five-factor and six-factor solutions.

With the initial 48 items we conducted three rounds of EFA and gradually discarded 232 problematic items. (cross-loading items and poor factor loading (<.30) items). Finally, a 233 five-factor EFA solution with 25 items was accepted with low RMSR = 0.08 (Brown, 234 2015), all factor-loading higher than .30 and no cross-loading greater than .30. We 235 further confirmed this five-factor latent structure by another EFA using varimax rotation 236 with a minimum residual extraction method (Table A1). Table 4 displays the 237 factor-loading (structural coefficients) and communality of the items. The absolute value 238 of the factor-loading ranged from .49 to .99 indicating strong coefficients. The 239 commonalities ranged between .11 to .99. However, the histogram of the absolute 240 values of non-redundant residual-correlations (Figure 5) showed 26% correlations 241 greater than the absolute value of .05, indicating a possible under-factoring. (Desjardins 242 & Bulut, 2018). Subsequently, we fitted a six-factor solution. However, a factor emerged with only one salient variable loading in the six-factor solution, thus disqualifying the six-factor solution (Table A2). Internal consistency reliability coefficient Cronbach's alpha assumes all the factor-loadings of the items under a factor are equal (Graham, 2006; Novick & Lewis, 1967) which is not the case in our sample. Additionally Cronbach's 247 alpha coefficient has a tendency to deflate the estimates for Likert type data as the calculation is based on pearson-correlation matrix which requires that response data 249 should be in continuous of nature (Gadermann, Guhn, & Zumbo, 2012; Zumbo, 250 Gadermann, & Zeisser, 2007). Subsequently to get better estimates of reliability we 251 reported ordinal alpha which used polychoric-correlation matrix and assumed that the 252 responses data were ordered in nature instead of continuous (Zumbo et al., 2007). 253 Ordinal alpha coefficient value ranges from 0 to 1 and higher value represents better 254 reliability. In the five-factor solution, the first factor contained three items and explained 255 10.25% of the total variance with a internal reliability coefficient ordinal α = .94. All the 256 items in this factor stemmed from the individual's preference to use blue light filters in 257 different light environments. The second factor contained six items and explained 9.93%

of the total variance with a internal reliability coefficient ordinal α = .76. Items under this factor commonly investigated an individual's hours spent outdoor. The third factor 260 contained five items and explained 8.83% of the total variance. Items under this factor 261 dealt with the specific behaviors pertaining to using phone and smart-watch in bed. The 262 internal consistency reliability coefficient was, ordinal α = .75. The fourth factor 263 contained five items and explained 8.44% of the total variance with an internal 264 consistency coefficient, ordinal α = .72. These five items investigated the behaviors 265 related to individual's light exposure before bedtime. Lastly, the fifth factor contained six 266 items and explained 6.14% of the total variance. This factor captured individual's 267 morning and daytime light exposure related behavior. The internal consistency reliability 268 was, ordinal α = .62 . It is essential to attain a balance between psychometric properties and interpretability of the common themes when exploring the latent structure. As all of the emerged factors are highly interpretable and relevant towards our aim to capture 271 light exposure related behavior, regardless of the apparent low reliability of the fifth factor, we retain all the five-factors with 23 items for our confirmatory factor analysis (CFA). Two items showed negative factor-loading (items 44 and 21). Upon inspection, it was 274 understood that these items are negatively correlated to the common theme, and thus in the CFA analysis, we reversed the response code for these two items. Figure 6 depicts the data distribution and endorsement pattern for the included items in our LEBA tool for 277 both the EFA and CFA sample. 278

Confirmatory Factor Analysis

We conducted categorical confirmatory factor analysis with robust weighted least square (WLSMV) estimator since our response data was of ordinary nature (Desjardins & Bulut, 2018). Several indices are suggested to measure model fit which can be categorized as absolute, comparative and parsimony fit indices (Brown, 2015). Absolute fit assess the model fit at an absolute level using indices including χ^2 test statistics and

the standardized root mean square (SRMR). Parsimony fit indices including the root mean square error of approximation (RMSEA) considers the number of free parameters 286 in the model to assess the parsimony of the model. Comparative fit indices evaluate the 287 fit of the specified model solution in relation to a more restricted baseline model 288 restricting all covariances among the idicators as zero. Comparative fit index (CFI) and 289 the Tucker Lewis index (TLI) are such two comparative fit indices. Commonly used 290 Model fit quidelines (Hu & Bentle, 1999; Schumacker & Lomax, 2004) includes (i) 291 Reporting of χ^2 test statistics (A non-significant test statistics is required to reflect model 292 fit) (ii) CFI and TLI (CFI/TLI close to .95 or above/ranging between 90-95 and above) (iii) 293 RMSEA (close to .06 or below), (iv) SRMR (close to .08 or below) to estimate the model 294 fit. Table 5 summarizes the fit indices of our fitted model. Our fitted model failed to attain 295 an absolute fit estimated by the χ^2 test. However, the χ^2 test is sensitive to sample size and not recommended to be used as the sole index of absolute model fit (Brown, 2015). Another absolute fit index we obtained in our analysis was SRMR which does not work well with categorical data (C. Yu, 2002). We judged the model fit based on the comparative fit indices: CFI, TLI and parsimony fit index:RMSEA. Our fitted model 300 attained acceptable fit (CFI =.94; TLI = .93); RMSEA = .06,[.05-.07, 90% CI]) with two imposed equity constrain on item pairs 32-33 [I dim my mobile phone screen within 1 302 hour before attempting to fall asleep.; I dim my computer screen within 1 hour before 303 attempting to fall asleep.] and 16-17 [I wear blue-filtering, orange-tinted, and/or 304 red-tinted glasses indoors during the day.; I wear blue-filtering, orange-tinted, and/or 305 red-tinted glasses outdoors during the day.]. Items pair 32-33 stemed from the 306 preference of dimming electric device's brightness before bed time and items pair 16 and 307 19 stemed from the preference of using blue filtering or colored glasses during the 308 daytime. Nevertheless, SRMR value was higher than the guideline (SRMR = .12). 300 Further by allowing one pair of items (30-41) [I look at my smartwatch within 1 hour 310 before attempting to fall asleep.; I look at my smartwatch when I wake up at night.] to

covary their error variance and discarding two item (item 37 & 26) for very low r-square 312 value, our model attained best fit (CFI = .97; TLI = .96); RMSEA = .05[.04-.06, 90% CI]) 313 and SRMR value (SRMR = .09) was also close to the suggestions of Hu and Bentle 314 (1999). Internal consistency ordinal α for the five factors of LEBA were .96, .83, .70, .69, 315 .52 respectively. We also estimated the internal consistency reliability of the total scale 316 using Mcdonald's ω (total) coefficient which is a better reliability estimate for 317 multidimensional constructs (Dunn, Baguley, & Brunsden, 2014; Sijtsma, 2009). 318 McDonald's ω (total) coefficient for the total scale was .73. 319

Measurement Invariance

Measurement invariance (MI) evaluates whether a construct has the psychometric 321 equivalence and same meaning across groups or measurement occasions (Kline, 2015; 322 Putnick & Bornstein, 2016). We used structural equation modeling framework to assess 323 the measurement invariance of our developed tool across two groups: native English 324 speakers and non-native English speakers. Our measurement invariance testing 325 involved successively comparing the nested models: configural, metric, scalar, and 326 residual invariance models with each others (Widaman & Reise, 1997). Among these 327 nested models configural model is the first and least restrictive model. The configural 328 model assumes that the number of factors and item number under each factor will be 329 equal across two groups. The metric invariance model assumes configural invariance of the fitted model and requires the factor-loadings of the items across the two groups to be 331 equal. Having the factor-loadings equal across groups indicates each item contributes to the measured construct equivalently. Scalar invariance assumes the metric invariance of 333 the fitted model demands the item intercepts to be equivalent across groups. This equity of item intercepts indicates the equivalence of response scale across the groups, i.e., 335 persons with the same level of the underlying construct will score the same across the 336 groups. The residual invariance model assumes metric invariance for the fitted model 337

and adds the assumption of equality in error variances and covariances across the groups. This model is the highest level of MI and assures the equivalence of precision of 330 items across the groups in measuring the underlying constructs. The invariance model fit 340 of our tool was assessed using the fit indices including χ^2 test, CFI and TLI (close to .95 341 or above), RMSEA (close to .06 or below) (Hu & Bentle, 1999). We excluded SRMR 342 from our consideration as it does not behave optimally for categorical variables (C. Yu, 343 2002). Table 6 summarized the fit indices. The comparison among different measurement invariance models was made using the χ^2 difference test ($\Delta\chi^2$) to assess whether our obtained latent structure of "LEBA" attained the highest level of the 346 MI. A non-significant $\Delta\chi^2$ test between two MI models fit indicates mode fit does not significantly decrease for the superior model (Dimitrov, 2010) thus allowing the superior level of invariance model to be accepted. We started our analysis by comparing the model fit of the least restrictive model:configural model to metric MI model and continued successive comparisons. Table 6 indicates that our fitted model had acceptable fit indices for all of the fitted MI models. The model fit did not significantly decrease across 352 the nested models up to the scalar MI model. The chi-square value difference between 353 the scalar and residual model is zero, indicating model fit remained the same for both: scalar and residual MI model, indicating the acceptability of the residual MI model.

56 Semantic Analysis

357

361

362

363

To find out if our developed tool is overlapping with existing instruments, we subjected the items of LEBA to the "Semantic Scale Network"(SSN) analysis (Rosenbusch et al., 2020). The SSN detects semantically related scales and provides cosine similarity index ranging between -.66 to 1 (Rosenbusch et al., 2020). Pair of scales with a cosine similarity index value of 1 indicates they are perfectly semantically similar scales indicating redundancy. LEBA appeared most strongly related to scales about sleep: "Sleep Disturbance Scale For Children" (Bruni et al., 1996) and

"WHO-Composite International Diagnostic Interview (CIDI): Insomnia"(WHO, 1990).The
cosine similarities lie between .47 to .51. Two factors of our LEBA tool: "Using phone and
smart-watch in bed" and "Using light before bedtime" dealt with light exposure related
behavior pertaining to sleep quality. As such the similarity index obtained is expected.

Developing Short form of LEBA

388

380

We sought the item response theory (IRT) to develop the short form of LEBA. IRT 369 the conventional classical test theory-based analysis by gathering information on item 370 quality by indices like item difficulty, item discrimination, and item information (Baker, 2017). IRT judges the item's quality on item information in relation to participants' latent trait level (θ). We gathered evidence on item quality by fitting each factor of LEBA with 373 the graded response model (Samejima, Liden, & Hambleton, 1997) to the combined EFA and CFA sample (n =690). Item discrimination indicates the pattern of variation in the 375 categorical responses with the changes in latent trait level (θ), and item information 376 curve (IIC) indicates the amount of information an item carries along the latent trait 377 continuum. Here, we reported the item discrimination parameter and only discarded the 378 items with relatively flat item information curve (information <.2) to develop the short form 379 of LEBA. Baker (2017) categorized the item discrimination in as none = 0; very low =0.01 380 to 0.34; low = 0.35 to 0.64; moderate = 0.65 to 1.34; high = 1.35 to 1.69; very high > 1.70. 381 Table 7 summarizes the IRT parameters of our tool. Item discrimination parameters of 382 our tool fell in very high (10 items), high (4 items), moderate (4 items), and low (5 items) 383 categorizes indicating a good range of discrimination along the latent trait level (θ). 384 Examination of the item information curve 8 indicated 6 items (1, 25, 9, 38, 30, & 41) had 385 relatively flat information curves thus discarded creating a short form of LEBA with 5 factors and 17 items. 387

Test information curve (TIC) (Figure 9) indicate the amount of information an the full-scale carry along the latent trait continuum. As we treated each factor of short-LEBA

as an unidmensional construct we obtain 5 TICs (Figure 9). These information curves indicated except blue filter factor, the other factor's TICs are roughly centered on the center of the trait continuum (θ). Also the amount of information changed rather steadily with the change of (θ) . Thus we conferred the LEBA tool (except blue filter) estimated the light exposure related behavior with precision near the center of trait continuum (Baker, 2017) which is sufficient to discriminate between latent trait measured by the each factor. The blue filter factor had a peak to the right side of the center of latent trait indicating its ability to providing information only for people who already have some preference towards using blue-filters.

Table 8 summarizes the item fit indexes of the items. All the items fitted well to the respective models as assessed by RMSEA value obtained from Signed- χ^2 index implementation. All of the items had RMSEA value \leq .06 indicating adequate fit. Figure 10 depicts the person fit of out fitted models. Person fit indicates the validity and meaningfulness of the fitted model at the participants latent trait level (Desjardins & Bulut, 2018). We estimated the person fit statistics using standardized fit index Zh statistics (Drasgow, Levine, & Williams, 1985). Zh < -2 should be considered as a misfit. Fig indicates that Zh is larger than -2 for most participants, suggesting a good fit of the selected IRT models.

The overall we can concluded that IRT analysis indicated short form of LEBA is a psychometrically sound measure. Item fit indexes and person fit index for all five fitted model were acceptable. Items had diverse slope parameters indicating a good range of discrimination- the ability to differentiate respondents with different levels of the light exposure related behavior. All-in-all we can recommend the short form of LEBA to be used to capture light exposure related behavior.

414 Discussion

Table 1

Releated Scales

| Name | Author | Description | Relevant Items |
|---------------------|------------------------|-----------------------|----------------|
| Visual Light | Verriotto et al., 2017 | Eight-question | NA |
| Sensitivity | | survey to assess the | |
| Questionnaire-8 | | presence and | |
| | | severity of | |
| | | photosensitivity | |
| | | symptoms | |
| Office Light Survey | Eklundet al., 1996 | A survey to assess | NA |
| | | electrical lighting | |
| | | environment in office | |
| Harvard Light | Bajaj et al., 2011 | Self-administered | NA |
| Exposure | | semi-quantitative | |
| Assessment | | light questionnaire | |
| Questionnaire | | | |
| Hospital Lighting | Dianat et el., 2013 | 23 items | NA |
| Survey | | questionnaire to | |
| | | assess light | |
| | | environment in a | |
| | | hospital | |
| Morningness- | Horne et al., 1976 | 19 items | NA |
| Eveningness | | questionnaire to | |
| Questionnaire | | understand your | |
| | | body clock | |
| | | | |

Table 1

Releated Scales (continued)

| Name | Author | Description | Relevant Items |
|----------------------|----------------------|----------------------|---------------------|
| Munich Chronotype | Roenneberg et al., | 17 items | NA |
| Questionnaire | 2003 | questionnaire to | |
| (MCTQ) | | understand | |
| | | individuals phase of | |
| | | entrainment | |
| Assessment of Sleep | Olivier et.al., 2016 | 13 items | NA |
| Environment | | questionnaire | |
| | | measuring your | |
| | | sleep environment | |
| | | quality | |
| The Pittsburgh Sleep | Buysse et al., 1989 | 9 items inventory to | NA |
| Quality Index (PSQI) | | measure sleep | |
| | | quality and sleeping | |
| | | pattern | |
| Self-Rating of | Xie et al., 2021 | 29 Items | Item 3,22-25 and 29 |
| Biological Rhythm | | questionnaire | |
| Disorder for | | assessing four | |
| Adolescents | | dimensions of | |
| (SBRDA) | | biological rhythm | |
| | | disorder in | |
| | | adolescents | |

Table 1

Releated Scales (continued)

| Name | Author | Description | Relevant Items |
|---------------------|-----------------|----------------------|----------------|
| Photosensitivity | Wu et al., 2017 | 16 dichotomous | All itms |
| Assessment | | (yes/no) items | |
| Questionnaire (PAQ) | | questionnaire to | |
| | | assess "photophobia" | |
| | | and "photophilia" | |

Table 2

Demographics

| Variable | Overall, N = 690 | 1. EFA Sample, N = 428 | 2. CFA Sample, N = 262 | p-value | q-value |
|---|------------------|------------------------|------------------------|---------|---------|
| Age | 32.95 (14.57) | 32.99 (15.11) | 32.89 (13.66) | 0.5 | 0.5 |
| Sex | | | | 0.14 | 0.4 |
| Female | 325 (47%) | 189 (44%) | 136 (52%) | | |
| Male | 351 (51%) | 230 (54%) | 121 (46%) | | |
| Other | 14 (2.0%) | 9 (2.1%) | 5 (1.9%) | | |
| Gender-Variant Identity | 49 (7.2%) | 33 (7.8%) | 16 (6.2%) | 0.4 | 0.5 |
| Native English Speaker | 320 (46%) | 191 (45%) | 129 (49%) | 0.2 | 0.5 |
| Occupational Status | | | | 0.040 | 0.2 |
| Work | 396 (57%) | 235 (55%) | 161 (61%) | | |
| School | 174 (25%) | 122 (29%) | 52 (20%) | | |
| Neither | 120 (17%) | 71 (17%) | 49 (19%) | | |
| Occupational setting | | | | 0.3 | 0.5 |
| Home office/Home schooling | 303 (44%) | 194 (45%) | 109 (42%) | | |
| Face-to-face work/Face-to-face schooling | 109 (16%) | 68 (16%) | 41 (16%) | | |
| Combination of home- and face-to-face- work/schooling | 147 (21%) | 94 (22%) | 53 (20%) | | |
| Neither (no work or school, or in vacation) | 131 (19%) | 72 (17%) | 59 (23%) | | |

Five Factor Solution[Unmerged Responses] (24 Items)

F1

I use light therapy applying a blue light box.

I use light therapy applying a light visor.

I use light therapy applying a white light box.

I use light therapy applying another form of light device.

I use an alarm with a dawn simulation light.

F2

I spend more than 3 hours per day (in total) outside.

I spend between 1 and 3 hours per day (in total) outside.

I spend as much time outside as possible.

I spend 30 minutes or less per day (in total) outside.

I go for a walk or exercise outside within 2 hours after waking up.

I spend between 30 minutes and 1 hour per day (in total) outside.

F3

I look at my mobile phone screen immediately after waking up.

I use my mobile phone within 1 hour before attempting to fall asleep.

I check my phone when I wake up at night.

F4

I use a blue-filter app on my computer screen within 1 hour before attempting to fall asleep.

I seek out knowledge on how to improve my light exposure.

I dim my computer screen within 1 hour before attempting to fall asleep.

I discuss the effects of light on my body with other people.

I modify my light environment to match my current needs.

I dim my room light within 1 hour before attempting to fall asleep.

Five Factor Solution[Unmerged Responses] (24 Items)

I use as little light as possible when I get up during the night.

F5

I wear blue-filtering, orange-tinted, and/or red-tinted glasses indoors during the day.

I wear blue-filtering, orange-tinted, and/or red-tinted glasses outdoors during the day.

I wear blue-filtering, orange-tinted, and/or red-tinted glasses within 1 hour before attempting to fall asleep.

Appendix C

Disclaimer: This is a non-public version of LEBA (dated November 15, 2021) and still a
 work in progress. Please do not distribute!

LEBA captures light exposure-related behaviours on a 5 point Likert type scale
ranging from 1 to 5 (Never/Does not apply/I don't know = 1; Rarely = 2; Sometimes = 3;

Often = 4; Always = 5). The score of each factor is calculated by the summation of
scores of items belonging to the corresponding factor. The following instruction is given
before displaying the items: "Please indicate how often you performed the following
behaviours in the past 4 weeks."

Appendix D

LEBA Long Form (23 Items)

| | Items | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|---|--------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 1 | I wear blue-filtering, | | | | | |
| | orange-tinted, and/or | | | | | |
| | red-tinted glasses indoors | | | | | |
| | during the day. | | | | | |
| 2 | I wear blue-filtering, | | | | | |
| | orange-tinted, and/or | | | | | |
| | red-tinted glasses outdoors | | | | | |
| | during the day. | | | | | |
| 3 | I wear blue-filtering, | | | | | |
| | orange-tinted, and/or | | | | | |
| | red-tinted glasses within 1 | | | | | |
| | hour before attempting to fall | | | | | |
| | asleep. | | | | | |
| 4 | I spend 30 minutes or less | | | | | |
| | per day (in total) outside. | | | | | |

| | Items | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|----|-------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 5 | I spend between 1 and 3 | | | | | |
| | hours per day (in total) | | | | | |
| | outside. | | | | | |
| 6 | I spend between 30 minutes | | | | | |
| | and 1 hour per day (in total) | | | | | |
| | outside. | | | | | |
| 7 | I spend more than 3 hours | | | | | |
| | per day (in total) outside. | | | | | |

| | 1 hour before attempting to | | | | | |
| | fall asleep. | | | | | |

| | Items | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|----|--------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 11 | I look at my mobile phone | | | | | |
| | screen immediately after | | | | | |
| | waking up. | | | | | |
| 12 | I check my phone when I | | | | | |
| | wake up at night. | | | | | |
| 13 | I look at my smartwatch | | | | | |
| | within 1 hour before | | | | | |
| | attempting to fall asleep. | | | | | |
| 14 | I look at my smartwatch | | | | | |
| | when I wake up at night. | | | | | |
| 15 | I dim my mobile phone | | | | | |
| | screen within 1 hour before | | | | | |
| | attempting to fall asleep. | | | | | |
| 16 | I use a blue-filter app on my | | | | | |
| | computer screen within 1 | | | | | |
| | hour before attempting to fall | | | | | |
| | asleep. | | | | | |
| | | | | | | |

| | Items | Never/Does not apply/I don't know | Rarely | Sometimes | Often | Always |
|----|-----------------------------------|-----------------------------------|--------|-----------|-------|--------|
| 17 | I use as little light as possible | | | | | |
| | when I get up during the | | | | | |
| | night. | | | | | |
| 18 | I dim my computer screen | | | | | |
| | within 1 hour before | | | | | |
| | attempting to fall asleep. | | | | | |
| 19 | I use tunable lights to create | | | | | |
| | a healthy light environment. | | | | | |
| 20 | I use LEDs to create a | | | | | |
| | healthy light environment. | | | | | |
| 21 | I use a desk lamp when I do | | | | | |
| | focused work. | | | | | |
| 22 | I use an alarm with a dawn | | | | | |
| | simulation light. | | | | | |
| 23 | I turn on the lights | | | | | |
| | immediately after waking up. | | | | | |

Latent Structure, Reliability and Structural Validity

The long form of LEBA consists 23 items with five factors.

| Factor names | Items | Reliability Coefficients: ordinal alpha |
|---|--------------------------|---|
| F1: Wearing blue light filters | 1-3 | .96 |
| F2: Spending time outdoors | 4-9 (Item 4 is reversed) | .83 |
| F3: Using phone and smartwatch in bed | 10-14 | .70 |
| F4: Using light before bedtime | 15-18 | .69 |
| F5: Using light in the morning and during daytime | 19-23 | .52 |
| McDonald's Omega coefficient for the total scale | | .73(Total scale) |

LEBA -long form showed satisfactory structural validity (CFI =.97; TLI = .96; RMSEA = .05[.04-.06, 90% CI]; SRMR = .09).
